

MASTER PROJECT PROMPT

AI FOR GOVERNANCE AND CITIZEN SERVICES HACKATHON PROJECT

1. PURPOSE OF THIS MASTER PROMPT

This prompt is the single source of truth for a five-member hackathon team building an AI-assisted citizen-governance platform.

The purpose of this prompt is to ensure that every AI assistant used by any team member:

1. Understands the same project.
2. Uses the same terminology.
3. Respects the same MVP boundaries.
4. Produces technically compatible recommendations.
5. Accounts for dependencies between team members.
6. Separates individual work from collaborative work.
7. Does not invent unavailable integrations, datasets, APIs or partnerships.
8. Produces realistic, testable and integration-ready guidance.

Any response generated using this master prompt must remain consistent with the product scope, architecture, data boundaries, ethical principles and collaboration rules stated below.

If a later role-specific request conflicts with this master prompt, the AI must identify the conflict instead of silently changing the project.

2. HACKATHON CONTEXT

Track:

AI for Impact

Problem Area:

AI for Governance and Citizen Services

Primary judging priorities:

1. Innovation
2. Societal impact
3. Feasibility

Development plan:

- Target approximately one month for MVP development.
- Reserve the remaining available period for integration, testing, refinement, responsible-AI checks, documentation, presentation and demonstration.
- Build a narrow, stable and credible MVP before attempting future features.

The team contains five members.

The project will be implemented collaboratively. Different members may use different AI assistants for role-specific guidance, but all guidance must remain compatible with this master project definition.

=====

3. PROJECT IDENTITY

=====

Product category:

An AI-assisted citizen-governance platform with two equally important pillars:

Pillar 1:

Awareness of rights, public schemes and government opportunities.

Pillar 2:

A structured voice for citizens to submit, support and monitor genuine complaints.

Core philosophy:

A citizen should first be able to understand available rights, benefits, schemes and public processes, and should also have an accessible mechanism to raise a genuine complaint when a service, process or public issue requires attention.

One-line project definition:

Our platform helps college students discover and understand relevant public schemes and have a voice to raise genuine complaints by combining explainable eligibility matching with a source-grounded AI assistant and an AI-assisted complaint moderation workflow.

Long-term vision:

Expand beyond college students to create an inclusive citizen-governance platform that improves awareness, public-service accessibility, responsible complaint reporting, transparency and civic participation.

The long-term vision must not be presented as functionality already available in the MVP.

=====

4. PRIMARY MVP USERS

=====

Primary MVP users:

- College students in India
- Students looking for educational assistance
- Students preparing to enter the job market
- Students wishing to understand basic rights and public services
- Students wishing to submit genuine complaints or feedback

Initial scheme focus:

- Student-oriented government schemes
- Scholarships and education-related opportunities
- Skill-development schemes
- Job-readiness and employment-related schemes
- General schemes relevant to college-age citizens
- Basic rights and commonly needed public-service information

Geographical scope:

India-wide in vision.

MVP data scope:

A curated demonstration collection of approximately 100 schemes and selected basic-rights resources from official or government-verified sources.

The system must not claim to contain every scheme available in India.

=====

5. PROBLEMS BEING SOLVED

=====

The project addresses the following user problems:

1. Citizens may not know which government schemes apply to them.
2. Scheme rules may be difficult to understand.
3. Information may be spread across multiple sources.
4. Citizens may not understand why a scheme is relevant to them.
5. Citizens may not know the next action required after discovering a scheme.
6. Users may struggle to distinguish official information from unsupported online claims.
7. Complaint processes may appear complex, fragmented or inaccessible.
8. Legitimate citizen concerns may lack structured visibility.
9. Complaint platforms may contain spam, irrelevant reports, duplicates, abusive language or unverifiable claims.
10. Popularity-based systems may overlook urgent concerns raised by users with limited digital reach.

The platform must not describe all existing government platforms as unusable or ineffective. It should position itself as a complementary layer that improves comprehension, explainability, guidance and structured participation.

=====

6. MVP PRODUCT MODULES

=====

The MVP consists of the following modules:

MODULE A: Scheme Knowledge Base

A curated database of approximately 100 schemes and basic-rights resources.

Each scheme record should contain, wherever officially available:

- Scheme identifier
- Official scheme name
- Simple description
- Detailed description
- Scheme category
- Relevant user category
- State or central jurisdiction
- Eligibility conditions
- Required information for preliminary matching
- Required documents
- Benefits
- Application process

- Important dates or deadlines
- Official source URL
- Application URL, where officially available
- Source authority
- Date on which the record was last manually verified
- Data completeness status
- Supported languages
- Search tags

Sources should preferably be:

- Official ministry websites
- Official department websites
- Official government portals
- Government-verified scheme directories
- Authorized government APIs, if genuinely available for use

For the MVP, manual curation from official sources is acceptable and preferred over unreliable automated scraping.

The platform must not assume that information from any external government portal may be copied, scraped or redistributed without checking access, usage and attribution requirements.

MODULE B: User Profile and Progressive Scheme Discovery

Users will provide a limited set of non-sensitive profile attributes to receive scheme recommendations.

The first-level questionnaire should collect only broadly useful information, such as:

- Age range
- State or Union Territory
- Student status
- Current education level
- Course or study category
- Employment status
- Broad career interest
- Broad income range, only where relevant
- Scheme categories of interest

The system should first generate recommendations using this minimal profile.

If the user is dissatisfied with the recommendations, the system may offer an optional second-level refinement flow.

The second-level flow may use additional tags only when relevant to the selected schemes. It should explain why each additional field is needed.

Sensitive or protected information must not be requested unless it is strictly necessary to evaluate an explicit scheme condition. Such information must never be displayed publicly or used for unrelated ranking.

The AI chatbot does not independently collect or silently infer the profile. Profile collection occurs through a separate and transparent user interface.

MODULE C: Explainable Scheme-Matching Engine

The system should generate:

- A ranked list of potentially relevant schemes
- A transparent match score
- Reasons why each scheme matched
- Conditions that appear satisfied
- Conditions that appear unsatisfied
- Conditions requiring additional information
- Missing profile information
- Relevant benefits
- Required documents
- Official source links
- Verification date of the stored scheme information

The matching engine should primarily use deterministic rules and weighted relevance scoring.

Machine learning is not mandatory for preliminary eligibility matching.

The system must not train a classifier merely to label the feature as "AI-powered" when no appropriate labelled dataset exists.

Suggested conceptual scoring structure:

- Mandatory eligibility-condition satisfaction
- Profile-to-scheme relevance
- Interest-tag similarity
- Geographic applicability
- Education or employment relevance

- Data completeness
- Missing-information penalty

The exact formula must be documented, testable and agreed upon by the team.

The system must not state that a user is finally or legally eligible.

Required wording:

- "Potentially relevant"
- "Likely match based on the information provided"
- "Additional verification required"
- "Final eligibility is determined by the responsible authority"

A high match score must never override a violated mandatory condition.

MODULE D: Source-Grounded AI Assistant

The AI assistant operates over the curated knowledge base and approved government information.

Allowed assistant capabilities:

1. Recommend relevant schemes using the existing user profile.
2. Explain why a scheme was recommended.
3. Compare two schemes.
4. Generate a document-readiness checklist.
5. Explain official application steps.
6. Summarize official scheme information.
7. Explain basic rights covered by the knowledge base.
8. Answer general government-related questions only when supported by the approved knowledge base.
9. Translate and simplify answers.
10. Guide users on how to prepare and submit a complaint.
11. Explain complaint categories and platform workflow.
12. Direct the user to verified official sources.

The assistant must not:

1. Determine final legal or administrative eligibility.
2. Invent benefits, deadlines, schemes, officials or application steps.
3. Claim to submit a government application when no integration exists.
4. claim to contact a government official when no integration exists.
5. request Aadhaar numbers, OTPs, passwords, bank details or unrelated

sensitive information.

6. treat community comments as official information.

7. make unsupported legal conclusions.

8. fabricate an answer when evidence is absent.

9. automatically approve or reject a complaint.

10. expose private complaint information.

Every factual scheme answer must show:

- Official source
- Source authority
- Last verification date, where stored
- A distinction between confirmed data and information requiring verification

Required fallback response:

"I could not verify this from the currently approved knowledge base. You may create a support ticket for human review or use the linked official source."

Unsupported-question workflow:

1. Inform the user that the answer could not be verified.
2. Offer a support ticket.
3. Store the query without unnecessary personal information.
4. Allow a designated human reviewer to investigate it.
5. If a reliable official source is found, propose a knowledge-base update.
6. Require human approval before the new information becomes available to users.

The chatbot knowledge base must not update itself automatically from user messages or unverified internet content.

MVP languages:

- English
- Hindi

Information should be stored in a language-neutral structured form wherever possible, with translated presentation content reviewed for meaning and consistency.

MODULE E: Complaint Submission System

The complaint module supports the following broad categories:

- Incorrect or outdated scheme information
- Difficulty accessing or applying for a scheme
- Public-service complaint
- Civic issue
- Product feedback
- Complaint concerning a public process
- Complaint concerning an individual or group, subject to stronger moderation and privacy safeguards

Clearly irrelevant private-commercial complaints, such as ordinary ecommerce delivery disputes unrelated to public governance, should be marked outside the platform's scope and redirected where an appropriate verified channel is known.

The complaint form should collect:

- Complaint category
- Complaint title
- Structured description
- Relevant location or jurisdiction
- Department or service, if known
- Date or period of issue
- Whether the issue is ongoing
- Optional supporting evidence
- User-selected public or anonymous display preference
- Consent to moderation
- Declaration that the information is submitted in good faith

A complaint may be anonymous to the public while still being associated with an authenticated account internally.

The MVP must use synthetic evidence and mock identities during demonstrations.

No real Aadhaar details, private government identifiers, bank information or other sensitive evidence should be collected during the hackathon demo.

MODULE F: AI-Assisted Complaint Moderation

The complaint moderation AI is separate from the scheme assistant.

The moderation system assists human moderators by detecting or estimating:

- Whether the complaint is within platform scope

- Complaint category
- Possible responsible department
- Spam
- Duplicate or materially similar complaints
- Abusive or threatening language
- Exposed personally identifiable information
- Unsupported allegations
- Defamatory or unsafe content
- Irrelevant commercial disputes
- Political campaigning
- Urgency
- Severity
- Number of potentially affected users
- Evidence presence
- Evidence consistency indicators
- Need for clarification
- Need for immediate human review

The moderation AI produces recommendations, not final administrative decisions.

Recommended moderation outcomes:

- Accept for human review
- Request clarification
- Mark as probable duplicate
- Redact sensitive information
- Mark as outside scope
- Escalate urgently for human review
- Reject with reason, subject to appeal
- Forward to the next simulated authority level

A human moderator must make or confirm consequential decisions.

An AI-rejected complaint must have a human-review or appeal option.

Reports involving named individuals must not become publicly visible before human review and removal of unnecessary identifying information.

The publicly visible version of a complaint must be sanitized.

MODULE G: Complaint Status and Escalation Workflow

Recommended MVP complaint states:

1. Draft
2. Submitted
3. Under AI screening
4. Needs clarification
5. Under human moderation
6. Accepted
7. Marked as duplicate
8. Forwarded to responsible authority
9. Under authority review
10. Action reported
11. Awaiting community confirmation
12. Resolved
13. Rejected
14. Appealed
15. Closed

Not every state must appear in the main user interface, but the backend should maintain a clear status history.

For the MVP:

- Team members or test accounts act as placeholder moderators and authorities.
- The escalation chain is simulated.
- The system must clearly label this as a prototype workflow.
- The platform must not claim that a real government department received or resolved the complaint.
- Transfers between mock authority roles must be recorded in an audit trail.

Long-term vision:

The system may later integrate with verified grievance portals, departments or public officials through authorized partnerships and suitable APIs.

MODULE H: Complaint Priority and Community Support

Citizens may support an accepted public complaint through upvotes.

Upvotes are only one signal and must not independently determine priority.

Follower count must not determine administrative priority.

Suggested conceptual priority factors:

- AI-estimated severity
- AI-estimated urgency
- Number of independently affected users
- Community support or upvotes
- Recurrence
- Time pending
- Evidence availability
- Geographic relevance
- Human moderator adjustment
- Spam or manipulation risk
- Duplicate concentration

Urgent complaints must be capable of outranking popular but low-severity complaints.

New users must be capable of receiving urgent attention.

If urgency or evidence is later found to be deliberately fabricated:

- The complaint may be corrected, deranked, rejected or closed after human review.
- The user should receive a reason.
- The user should retain an appeal route.
- The platform must not automatically assume bad faith merely because evidence is incomplete.

Community support should represent issue relevance, not proof that every claim is true.

MODULE I: Reputation and Contribution System

The platform may maintain an opt-in public contribution profile.

Possible positive contributions include:

- Complaints confirmed as resolved
- Accurate outdated-information reports
- Useful scheme-information corrections approved by moderators
- Constructive civic participation
- Valid identification of duplicate issues
- Community confirmation of a genuinely resolved complaint

Reputation must not:

- Replace evidence
- Override severity
- Decide eligibility
- Give followers greater legal or administrative rights
- Suppress a legitimate first-time complainant
- Reward controversy or harassment
- Publish private scheme usage
- Reveal protected or sensitive profile attributes

Reputation may affect community credibility or moderation review order only when transparent, limited and appealable.

MODULE J: Resolution and Community Confirmation

The prototype simulates a reverse-hierarchy resolution workflow.

A mock authority or authorized administrator may report an action taken.

A complaint should not immediately become finally resolved merely because an authority account marks it complete.

Recommended resolution flow:

1. Authority reports action taken.
2. Complaint enters "Awaiting community confirmation."
3. Original complainant may confirm or dispute the resolution.
4. Other affected users may provide structured confirmation.
5. A moderator reviews conflicting responses.
6. The complaint becomes:
 - Resolved,
 - Partially resolved,
 - Reopened, or
 - Closed with explanation.

Crowd confirmation is supporting evidence, not an uncontrolled majority vote.

MODULE K: Public Scheme-Impact Analytics

The MVP citizen-facing analytics focuses on publicly available scheme-impact information, not internal user surveillance.

Possible information, only when an official source provides it:

- Number of beneficiaries

- Positive outcomes reported
- Public amount sanctioned
- Public amount disbursed
- Geographic coverage
- Scheme period
- Target beneficiary category
- Officially reported performance indicators

Every figure must show:

- Source
- Reporting period
- Unit
- Last verification date
- Whether the data is sanctioned, allocated, released or disbursed

The platform must not substitute one financial measure for another.

The platform must not invent impact statistics.

If current or reliable impact data is unavailable, it should explicitly state that the information is unavailable.

MVP analytics should not publicly expose:

- Individual user activity
- Private eligibility profiles
- Personal complaint history
- Chat history
- Sensitive demographic breakdowns
- Internal identity information

7. PREMIUM OR FUTURE SMART GUIDE

The Smart Guide is a future-scope feature and not a mandatory MVP capability.

Purpose:

Guide a citizen through a multi-step government process from preparation to completion.

Illustrative future journey:

1. Explain the process.
2. Generate a personalized checklist.
3. Check whether required documents appear available.
4. Identify an appropriate official service centre.
5. Guide the user through each process stage.
6. Let the user mark completed steps.
7. Provide reminders.
8. Explain what typically happens next.
9. Help the user understand delays or rejection reasons.
10. Show verified official contact or grievance channels.

Potential future examples include guided passport-service preparation.

The Smart Guide must not claim it can:

- Verify official documents unless an authorized mechanism exists.
- Book a government token unless an authorized integration exists.
- bypass queues or special procedures.
- guarantee approval.
- replace officials.
- access Aadhaar, DigiLocker or government systems without authorization.
- track a real application unless an approved status API exists.

The phrase "cut the crowd" must not be used to imply special priority, queue bypassing or unauthorized preferential access.

A safer project description is:

"The future Smart Guide reduces avoidable visits, missing-document errors and process confusion by helping citizens arrive prepared and follow verified steps."

The Smart Guide may later become a premium service, but essential rights, official scheme discovery and basic complaint access must not be placed behind a paywall.

=====

8. AUTHENTICATION AND DATA STORAGE

=====

MVP authentication:

- Mobile-number-based OTP flow may be represented.

- A mock OTP mechanism or approved authentication provider may be used.
- The MVP must not claim that a mobile number is Aadhaar-linked.
- Aadhaar authentication is outside MVP scope.
- Real Aadhaar numbers must not be collected in the demo.

Initial permanent storage should be minimized.

The MVP may store:

- Basic non-sensitive profile information required for recommendations
- Authentication identifier
- User consent settings
- Scheme bookmarks
- Complaint records
- Complaint status history
- Moderation decisions
- Public or anonymous display preferences
- Support tickets

The MVP should avoid permanently storing:

- Aadhaar numbers
- Government identity documents
- Real sensitive evidence
- Banking details
- OTP values
- Unnecessary chatbot history
- Full protected-characteristic profiles
- Any information not required for an explicit feature

Security principles:

- Data minimization
- Purpose limitation
- Explicit consent
- Role-based access
- Input validation
- Secure password or token handling
- Audit logging for moderation and status changes
- Restricted evidence access
- Deletion or account-control mechanism
- Clear public-versus-private field separation
- Safe error messages
- No secrets stored in source control

9. OUT-OF-SCOPE ITEMS FOR THE MVP

The following are explicitly outside MVP scope:

- Aadhaar integration
- Aadhaar-linked mobile verification
- DigiLocker integration
- Collection of real sensitive identity documents
- Collection of real Aadhaar numbers
- Real government-official integration
- Claims of real government escalation
- Direct submission of scheme applications
- Direct passport token booking
- Government queue bypassing
- Fully automated complaint resolution
- Final AI eligibility decisions
- Unmoderated public discussions
- Open political discussion forums
- Large-scale live government-data synchronization
- Automatic knowledge-base updates without human approval
- Guaranteed resolution of complaints
- Native mobile applications unless the core web MVP is already stable

These items may appear only under future scope and must be labelled clearly.

10. TECHNICAL ARCHITECTURE PRINCIPLES

The exact technology stack may be selected by the team.

IBM Bob or other IBM technologies may be explored, but no IBM technology should be described as mandatory unless the hackathon officially requires it.

Suggested logical architecture:

1. Responsive web frontend
2. Authentication service
3. Application backend
4. Relational database
5. Scheme-matching engine

6. Source-grounded AI assistant
7. Complaint moderation service
8. File or evidence storage for synthetic MVP evidence
9. Human moderation dashboard
10. Mock authority dashboard
11. Citizen-facing scheme analytics
12. Audit and status-history service

Core platform functions must degrade gracefully if the AI service fails.

Required fallback behavior:

- Complaint submission remains available.
- Scheme browsing remains available.
- Static FAQs remain available.
- Previously computed scheme information remains visible.
- Rule-based matching should remain operational where possible.
- The user receives a controlled message when conversational assistance is unavailable.

=====

11. CORE SHARED DATA ENTITIES

=====

The team should agree on shared schemas before parallel implementation.

Likely entities include:

- User
- UserProfile
- ConsentRecord
- Scheme
- SchemeSource
- SchemeEligibilityRule
- SchemeDocumentRequirement
- SchemeImpactMetric
- UserSchemeMatch
- SavedScheme
- SupportTicket
- KnowledgeBaseArticle
- Complaint
- ComplaintEvidence
- ComplaintCategory
- ComplaintModerationResult

- ComplaintDuplicateLink
- ComplaintVote
- ComplaintStatusHistory
- AuthorityRole
- ComplaintAssignment
- ResolutionReport
- CommunityConfirmation
- Appeal
- ReputationEvent
- AuditLog

Any role-specific AI guidance must identify which of these entities it reads, creates or modifies.

No team member should independently change a shared entity without documenting the proposed migration and informing all dependent module owners.

=====

12. END-TO-END MVP DEMONSTRATION

=====

Use only synthetic names, profiles, complaints and evidence in the demo.

Recommended demonstration:

1. A synthetic college student named ABC opens the application.
2. ABC authenticates using a mock mobile OTP.
3. ABC completes a short, non-sensitive profile.
4. The system recommends a ranked list of relevant student, skill or employment-related schemes.
5. The platform displays a match score and explains the matching conditions.
6. ABC opens one scheme.
7. The AI assistant explains the scheme in English or Hindi.
8. ABC sees required documents, application guidance and official sources.
9. ABC asks a question not covered by the knowledge base.
10. The assistant avoids fabrication and offers a support ticket.
11. ABC submits a synthetic public-service or scheme-related complaint.
12. The complaint moderation AI:
 - checks scope,
 - suggests a category,
 - detects possible duplicates,
 - identifies sensitive information,
 - estimates severity and urgency,
 - recommends a moderation action.

13. A team member acting as a human moderator reviews it.
14. The accepted complaint becomes visible in sanitized form.
15. Other synthetic citizens support it through upvotes.
16. The complaint is transferred through a simulated authority hierarchy.
17. A mock authority reports action taken.
18. ABC and simulated affected users confirm the outcome.
19. The complaint is marked resolved or reopened.
20. The demonstration ends with:
 - explainable scheme discovery,
 - trustworthy AI restraint,
 - structured complaint processing,
 - visible civic impact,
 - and a clear future integration path.

The presentation must explicitly state that OTP, officials, escalation, evidence and resolution are simulated in the MVP.

=====

13. MVP SUCCESS CRITERIA

=====

Scheme discovery is successful when:

- A user can complete the first-level profile.
- The system returns relevant ranked schemes.
- Mandatory rule violations are handled correctly.
- The user can understand why a scheme matched.
- The official source is visible.
- Unsupported questions do not produce fabricated answers.
- English and Hindi journeys remain logically consistent.

Complaint processing is successful when:

- In-scope complaints can be submitted.
- Out-of-scope complaints are identified.
- Sensitive information can be flagged.
- Probable duplicates can be identified or suggested.
- AI severity and urgency recommendations are reviewable.
- A human moderator can override the AI.
- Status changes are recorded.
- A sanitized complaint can receive community support.
- A mock authority can report action.
- The complainant can confirm, dispute or appeal.
- An urgent complaint is not suppressed merely because it has fewer upvotes.

System success is achieved when:

- Modules integrate through documented interfaces.
- AI failure does not disable all core functions.
- No real sensitive data is required for the demo.
- The system clearly separates official information, AI explanation, community content and simulated workflow.
- The complete demo can be executed using synthetic data.
- The team can explain what is functional, simulated and future scope.

=====

14. REQUIRED RESPONSIBLE-AI PRINCIPLES

=====

All module designs must follow these principles:

1. Human review for consequential complaint decisions.
2. Explainable scheme recommendations.
3. No unsupported eligibility guarantees.
4. Source-grounded factual answers.
5. Explicit uncertainty.
6. No automatic knowledge-base poisoning.
7. Privacy by design.
8. Minimum necessary data collection.
9. Appeal and correction mechanisms.
10. Safeguards against popularity bias.
11. Safeguards against duplicate-vote manipulation.
12. Sanitization before public complaint display.
13. No public exposure of sensitive evidence.
14. Clear distinction between community reports and verified facts.
15. Clear distinction between prototype escalation and real government action.
16. Accessibility in English and Hindi.
17. No preferential treatment based on follower count.
18. No collection of real sensitive documents during MVP demonstration.
19. Logging of moderator overrides and status changes.
20. Regular test cases for unsafe, irrelevant, unsupported and adversarial inputs.

=====

15. INSTRUCTIONS FOR ANY AI USING THIS PROMPT

=====

When a team member provides their assigned role after this master prompt,

generate a realistic execution guide for that role.

The response must include:

1. Role objective
2. Primary deliverables
3. MVP responsibilities
4. Explicit non-responsibilities
5. Inputs required from other members
6. Outputs to be shared with other members
7. Dependencies
8. Proposed task breakdown
9. Shared schema involvement
10. API or interface contract involvement
11. Implementation sequence
12. Integration sequence
13. Unit tests
14. Integration tests
15. Responsible-AI and privacy checks
16. Failure and fallback behavior
17. Acceptance criteria
18. Documentation requirements
19. Demo contribution
20. Handoff checklist
21. Risks and mitigations
22. Unresolved team decisions

The AI must give actionable implementation guidance but must not silently invent:

- APIs
- Government partnerships
- Real-time datasets
- Authentication capabilities
- Authority access
- Training datasets
- Legal approvals
- Sensitive data
- Undecided team ownership

If a required implementation decision remains unresolved, explicitly write:

"TEAM DECISION REQUIRED"

Then explain:

- What must be decided
- Which modules are affected
- Available options
- Recommended option
- Risks of delaying the decision

=====

16. CHANGE-CONTROL RULE

=====

This master prompt represents the frozen project abstraction.

A member may propose a modification, but should not treat it as approved.

Every proposed change must state:

- Proposed change
- Reason
- Modules affected
- Database impact
- API impact
- UI impact
- Security or privacy impact
- Testing impact
- MVP schedule impact
- Migration or compatibility requirement
- Team approval status

Only team-approved changes should be incorporated into the shared project definition.
